In the United States alone, the number of people reaching retirement age is expected to grow from 12 percent to 20 percent in the next 15 years. Countries around the world are facing the same scenario.

Maintaining good health is an issue we all face as we age, and the aim of DENSO’s Health Monitoring System is to make that easier. Based on the idea of daily checkups to stay healthy, this system automatically collects medical and health-related information and checks and monitors the user’s physical condition. The goal is to help users prevent disease, as well as help detect disease in the very early stages when it’s most treatable.

What it does:
- Takes biometric measurements and provides them to health care providers like your doctor
- Allows you to see real-time data and an analysis of the data from almost anywhere, including smart phones, tablets, and personal computers
- Collects data while you’re sleeping to measure biometrics, like respiration

How it works:

Protecting lives, preserving the planet and preparing a bright future for generations to come.
